

1. Common attribute and matching rows

Common attribute (same name in both tables): **DEPT**.

Natural join condition: automatically **EMP.DEPT = DEPART.DEPT**.

Matching pairs:

- Sumith (CS) ↔ CS row in DEPART → OK.
- Ravi (Econ) ↔ Econ row in DEPART → OK.
- Kiran (Elec) ↔ no Elec in DEPART → **no match** → **dropped**.
- Sathish (Econ) ↔ Econ row in DEPART → OK.

Fin and Hist rows of DEPART have no matching employee → dropped.

2. Natural join result

Start from the equi- join result (which had both emp.DEPT and depart.DEPT) and **keep only one DEPT column**:

NAME	OFFICE	DEPT	SALARY	MAIN OFFICE	PHONE
Sumith	400	CS	25000	404	2436789
Ravi	220	Econ	30000	200	2378658
Sathish	420	Econ	40000	200	2378658

So, natural join = inner equi- join on all same- named attributes **plus** automatic removal of duplicate join columns.
